

### INSTALLATION, OPERATION & MAINTENANCE INSTRUCTIONS

#### GENERAL INFORMATION

1. Clean the lines of all foreign material, (welding slag, pipe scale, dirt, thread chips etc.). Upstream installation of a strainer may be necessary in dirty systems.
2. Air should be eliminated from the system prior to startup to assure quiet operation, freedom from water hammer and correct flow.

#### INSTALLATION

1. Threaded hose ends are made with inch series NPT threads in accordance with ANSI STD B1.20.1 and are intended for use in Building Services Piping meeting the requirements of ASME B 31.9.
2. Swivels are usually mounted closest to the heat pump.
3. ½” through 1-1/4” hoses have a removable threaded adapter. There should be a fiber gasket inside of the female swivel end of the hose to prevent leaking when the adapter is connected to the female swivel end of the hose. This gasket **MUST** be in place to prevent leaking. **DO NOT** use any type of tape or compound on the adapter or female swivel connection. These are straight threads and require a gasket to form a proper seal. Use of any sealant material will not prevent leaking and will void any warranty that may be expressed or implied. See Hays Fluid Controls current Terms & Conditions.
4. Check application for proper; Hose Length, so as to prevent Kinks, Twists, Sharp Bends, Stretching and Chafing.
5. Apply thread sealant to male pipe threads, starting with the second or third thread from the end, (CAUTION, if factory applied thread sealant is present, **DO NOT ADD ADDITIONAL SEALANT, DO NOT TWIST JOINTS WITH SEALANT ALREADY PRESENT AS THIS MAY CREATE A LEAKTHROUGH THE SEALANT**). Torque the connection to 75 foot pounds per inch of pipe size minimum. Example: (1 ½ ”, 1.5 X 75 = 113 ft lb. Min.) (¼”, .25 X 75 = 19 ft lb. Min.)
6. Rotates the components having P/T Taps or P Taps so that they are **NOT POINTING DOWN**.
7. Inspect installation for leaks, hose kinks, and twisting of the hose, sharp bends, stretching and possible chafing.

**Note:** Hose can be installed straight, but not stretched or taut.

## **OPERATION**

1. For optimum operation, hoses should be sized correctly for the flow rate specifications, including noise sensitive applications.
2. ½” to 2” hoses are stainless steel braid over an EPDM liner. Temperature ranges meet or exceed Hays specification of 32°F to 225°F.
3. 2-1/2” to 3” hoses are stainless steel braid over corrugated 300 stainless steel tube, butt welded to carbon steel end fittings. Temperature ranges meet or exceed Hays specification of 32°F to 225°F.
4. Working pressure meets or exceeds Hays specification of 400 psig.
5. Minimum burst pressure shall be 4 times the working pressure.

## **MAINTENANCE**

1. General maintenance is not required for Hays Hoses, however if the system experiences large amounts of pipe scale due to poor water conditions, some maintenance may be required.
2. Provisions should be made to keep the system clean. Proper water treatment is also recommended.
3. Periodically check to make sure the hoses are free from strain or damage.

## **LIMITED WARRANTY**

See Hays Fluid Controls terms & conditions
